

Upgrading React Native projects

with Pavlos Vinieratos

React Native EU
Wroclaw, Poland

6 September 2019

I'm Pavlos.

`pvinis` on almost everything online.

I work with `Sense Health` making `NiceDay`.

I am involved with

- `upgrade-helper`
- `rn-diff-purge`
- `react-native` PRs

I love upgrading!

js/ts has packages like babel, metro, eslint, tsc upGrade was just change the package number, yarn install, and see if it works. some devs had ideas to automate this, and we got the original [react-native upgrade](#), [rnpm upgrade](#), [react-native-git-upgrade](#), the rn-diff repo, rn-diff-purge. suffice it to say there were many iterations. kept rn-diff with a list of patches genarated from upgrading a simple rn app, that other users could apply. i found that and always manually upgraded, since that way i had a good idea of what changed. after a while, that got hard to maintain, so guess what, (xkcd about the frameworks +1) i forked rn-diff and made rn-diff-purge since it had to change the gen script enough. so it was easier as a fork. i wanted it for me, as i was and am still a fan of manual upgrading.
